bRealTime,

I'm writing to apply for your Front-End/Full-Stack Engineer position. I have spent the past six years professionally working as a Full-Stack Developer and growing in my skill-set. Learning and programming are two very strong passions of mine. In every position I've held, I have demonstrated a willingness to own my roles and projects and have shown an ability to overcome every challenge—all while having fun.

As a Senior Software Engineer at Rise Interactive, I was challenged with a variety of projects I mastered for our clients. Working on a total site rebuild and infrastructure migration for Kaplan University, I was challenged with quickly learning C#, so that I may build out all the data classes on the project. In 3 weeks, I was comfortably working in C#. In 3 months, I was a lead for the project, coordinating with my team and management about features and components built throughout the site. I built all the dynamic drop-downs, carousels, site search functionality (via SOLR), and data classes, helping my team meet our deadlines in record time.

When challenged with an Isomorphic React Application (server-side rendering), for our client AppDynamics (a billion dollar start-up at the time), I quickly picked up ReactJS. By building out the application, creating documentation, learning how to write test driven code for the version of React we used at the time, understanding React deployment via a server tool PM2, and more, I demonstrated my passion for learning and doing things correctly, with quality code.

After becoming the lead for our client ItWorks, I was tasked with understanding the needs for the project and regularly participating in the "discovery" phase of our projects. Having had previous experience with Angular 2, I picked up Angular 5 Universal and created a seed project for ItWorks. The seed project incorporated various requested features, such as translations per locale and visible client data to comply with EU regulations.

As a Full-Stack Developer at Caxy Interactive (LAMP stack), I worked toward solving tech problems for our largest client, International Code Council, for two years. To resolve issues ICC encountered, my team and I built out a new interface for administration and customers in Angular 2, mastered Symfony for back-end development, and digitized the entire internal processes for the client. While positioned as the company developer for Digital Third Coast, I was challenged, solely, with rebuilding the internal and external interfaces and platform API for the company. I rebuilt the entire platform and all front-end interfaces in 3 months. It greatly improved billing for client accounts, data visibility, customized analytics data, reports for paid search, and created synced databases. I continued improving the company until I sought greener pastures.

I hope to bring my passion for learning and skill-set to bRealTime, to contribute to an amazing team!

Sincerely,

Adam Velma
